

# DOMESTIC LPG INSTALLATION PRESSURE PROTECTION

THE PROBLEM: Many LPG regulators are compliant with UL144 which means the over pressure protection is around 8 to 9kPa. Many other regulators and Autochange Units have over pressure protection at 7kPa or 10kPa. When supplying domestic appliance such as instantaneous water heaters and hobs etc these appliances may have a maximum allowable overpressure of 5kPa or similar.

Shown below is our cost effective small relief which can be set between 4 and 9 kPa to protect downstream equipment. Contact us for further information.
